

Your computer. Your agents.

Mission Control. Scoped projects. Results you can inspect and undo.

For the first time in Shadowfetch Linux, choose Grok Bot at startup.

Actual candidate8 startup screen. Grok Bot is optional and requires an eligible vendor account, plan and internet connection.

shadowfetchlinux.org

Agent work you can review.

Mission Control

Code tasks, source reports and deterministic media exports share a persistent queue, activity records and a result-review workflow. Cloud code/report validation is still pending.

Featured Grok Bot

A prominent startup card, dedicated Control Center page and official native-app installer make Grok Bot a featured optional teammate. Final native-app capture and authenticated cloud work remain pending.

Scope and recovery

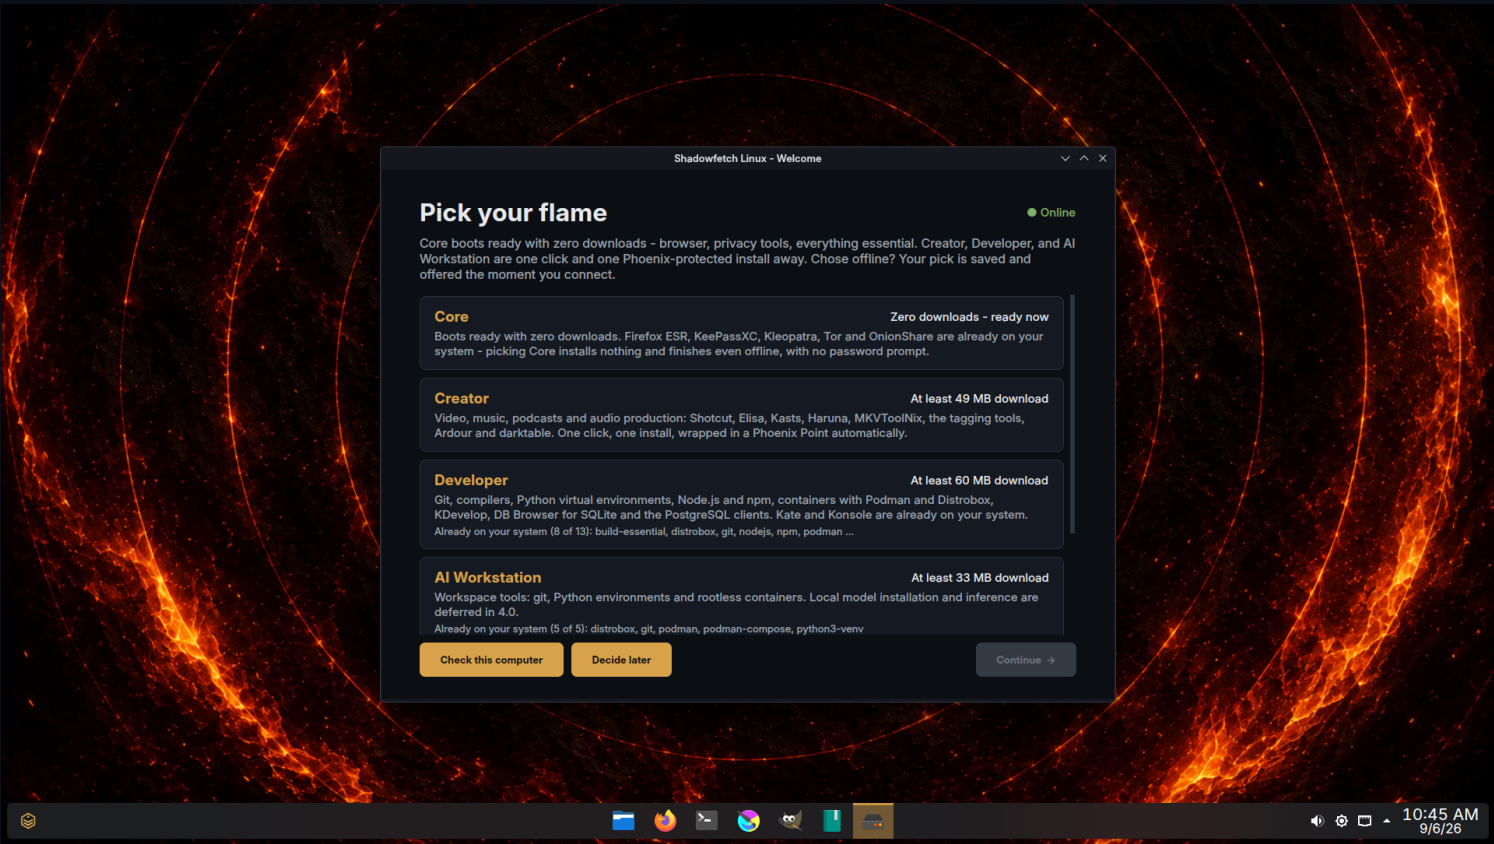

Firebreak gives missions a private home, explicit project access and bounded resources. Review changes before keeping them; Undo refuses newer manual edits.

Fire and Ice

Fire supports connected workflows. Ice starts offline and retains project workspaces and media tools. Local AI and Buzz are deferred for this release.

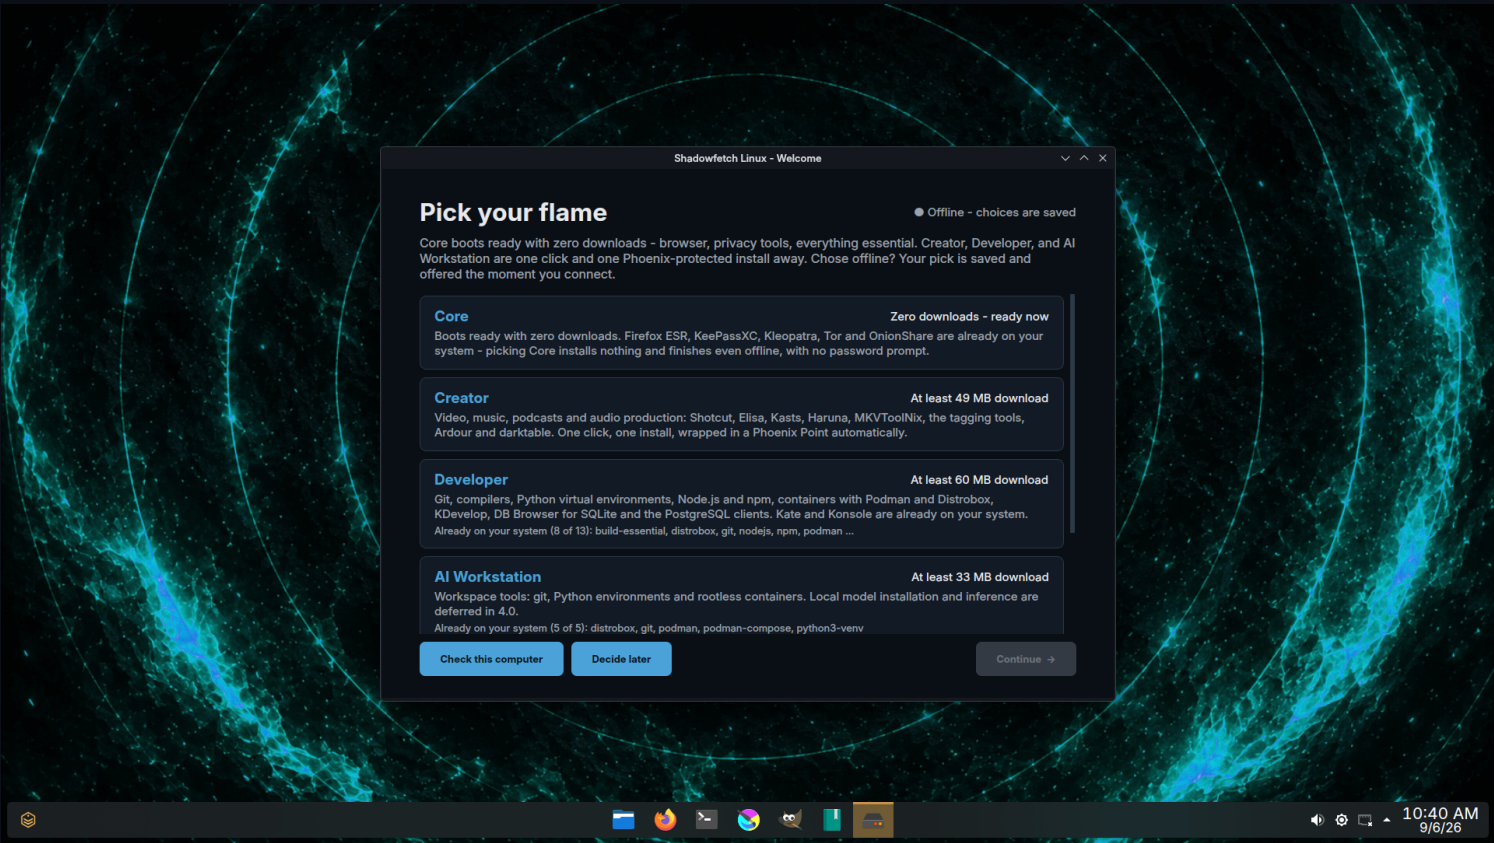

Independent coding agents

Choose supported coding tools independently. Codex missions can use a dedicated account sign-in or an API key; normal Codex history stays outside the mission environment.

Fire: connected setup

Actual installed BIOS Fire desktop and first-run choices.

Ice: offline setup

Actual installed UEFI Ice desktop. Local model installation and inference are deferred.

What is verified today.

The signed candidate8 image installed through native Calamares in separate BIOS Fire and UEFI Ice virtual machines. Both booted from disk and passed installed-system audits.

All 278 packaged /usr files matched the approved binary packages. Both installations passed 19 mission-engine checks. Ice passed 9 crash-recovery and resource-limit checks. These are VM results; they do not establish physical GPU performance or authenticated cloud success.

Release hold: the full 45-minute stress test is still running. Authenticated agent work, upgrade/rollback, final screenshots and public download verification remain outstanding. Do not send this packet as a shipped-release announcement yet.

Reviewer exercise: install and verify the image; choose a project; run a media task; inspect the output receipt; keep the result; test Undo. Then configure a coding agent and review a code task with unchanged tests.
